What is Rebalancing?

CryptoPack Rebalancing is a process that helps users keep their pack aligned with its intended investment strategy. As crypto prices move, the weight of each coin in the pack may change over time and drift away from the target allocation.

To bring the pack back on track, rebalancing adjusts the holdings by selling a portion of overweight coins and buying underweight coins. The pack may also be updated by ZebPay's trade experts based on market conditions, such as removing a poorly performing or delisted coin and adjusting the remaining allocation as required.

Why is Rebalancing Helpful?

- Helps keep the CryptoPack aligned with its intended strategy and target allocation.
- Maintains the planned risk and return profile of the pack.
- Reduces the need for users to manually monitor and adjust individual coins.
- Allows the pack to be updated based on market conditions or coin-related changes.
- Provides transparency by showing users what changed, when it changed, and any applicable fees or taxes after rebalancing.

FAQs

1. What is CryptoPack Rebalancing?

CryptoPack Rebalancing is a process that adjusts the coins in a pack back to their target allocation. It helps keep the pack aligned with its intended investment strategy.

2. Why is rebalancing needed?

Crypto prices keep changing. Due to this, some coins may become overweight or underweight in the pack. Rebalancing helps bring the pack back to its planned allocation.

3. How does rebalancing work?

Rebalancing works by selling a small portion of coins that have become overweight and buying coins that have become underweight, based on the pack's target allocation.

4. Is rebalancing done manually by the user?

No. Rebalancing is handled automatically as per the pack's rebalancing logic. Users do not need to manually buy or sell coins for rebalancing.

5. Does rebalancing help manage risk?

Yes. Rebalancing helps maintain the intended risk and return profile of the pack by preventing one coin from dominating the overall allocation.

6. What happens if a coin performs poorly or gets delisted?

If a coin performs poorly or gets delisted, it may be removed from the pack. The remaining pack allocation is then adjusted as required.

7. Can users see the rebalancing details?

Yes. Users can view what changed, when the rebalance happened, and the applicable transaction details after the rebalance.

8. Are fees and taxes applicable on rebalancing?

Yes. Since rebalancing may involve buying and selling coins, standard fees and applicable taxes may apply.

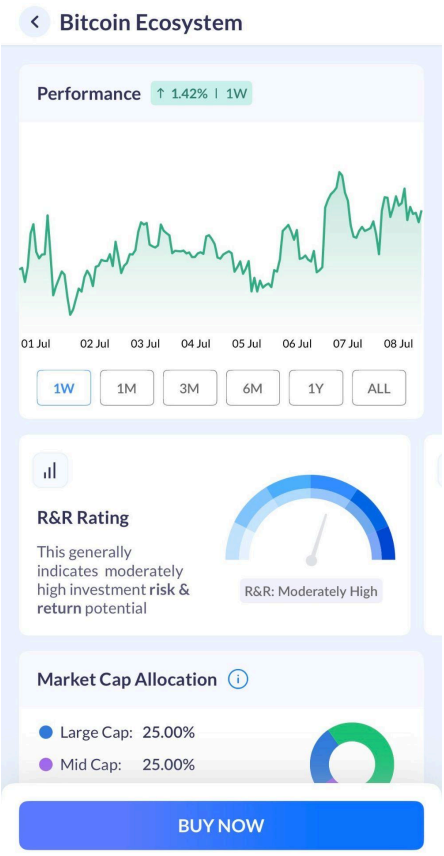

9. Does rebalancing guarantee profit?

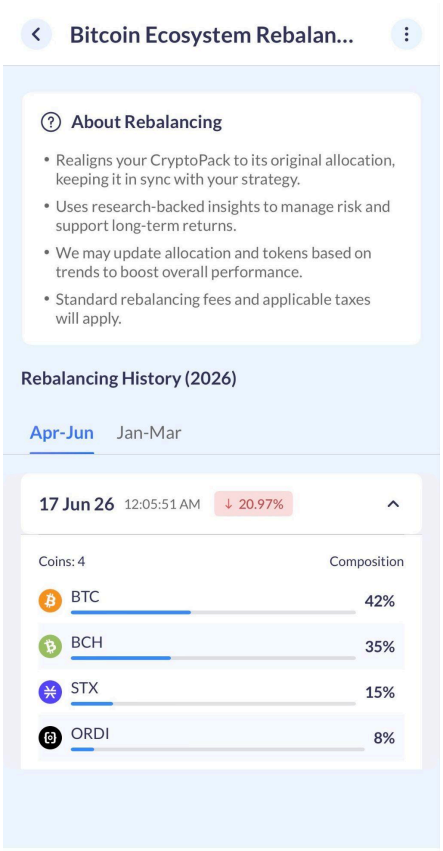

No. Rebalancing does not guarantee profit. It only helps keep the pack aligned with its intended strategy and allocation.

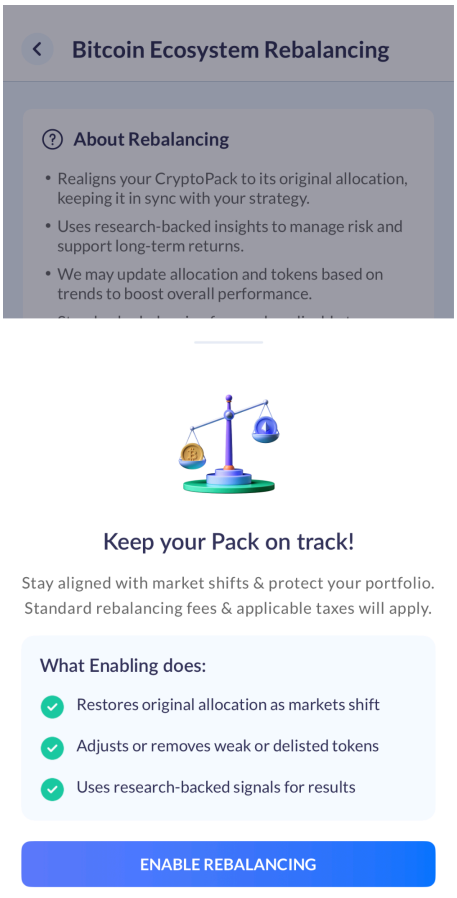

10. Can users enable or disable rebalancing?

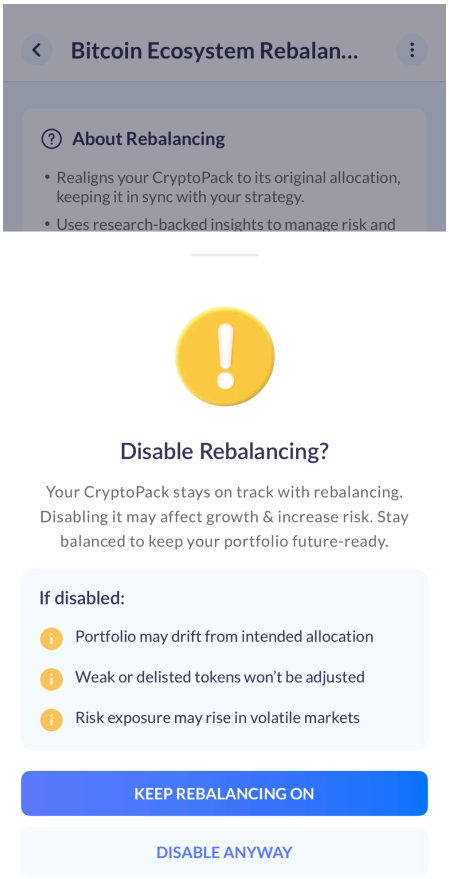

Yes. Users can enable or disable rebalancing anytime from the Rebalancing History section.

Proposed Script

Video Plan: "Keep Your CryptoPack on Track"
Duration: ~60 seconds
Style: App UI mockups mixed with modern 2D motion graphics
Tone: Dynamic, transparent, and expert-backed

Scene 1: What is Rebalancing? (0:00 - 0:15)

- **Visual:** Start with a clean mockup of the ZebPay app showing the **"Bitcoin Ecosystem"** CryptoPack. We zoom in on the *Composition* section (BTC at 42%, BCH at 35%, etc.). A fast-forward calendar effect happens, and the percentages start to skew as market prices fluctuate (e.g., BTC jumps to 55%, ORDI drops to 2%).
- **VO:** "Crypto markets never sleep. Over time, market movements can cause your CryptoPack—like the Bitcoin Ecosystem—to drift away from your original investment strategy."
- **On-Screen Text:** Market shifts change your target allocation.

Scene 2: The Automated Fix (0:15 - 0:25)

- **Visual:** A subtle glow highlights the "Rebalancing" section. The skewed percentages automatically fluidly slide back to their perfect original target weights (42%, 35%, 15%, 8%).
- **VO:** "CryptoPack Rebalancing fixes this. It automatically trims overweight coins and buys underweight ones, realigning your portfolio back to its optimal strategy."

- **On-Screen Text:** Auto-adjusts back to target allocation.

Scene 3: Expert Analysis & Adjustments (0:25 - 0:38)

- **Visual:** Transition from the app screen to a sleek motion-graphics scene. A magnifying glass hovers over a coin icon. A "weak token" is identified and smoothly swapped out for a rising token based on a trend line graphic.
- **VO:** "It’s not just an algorithm. ZebPay’s trade experts continuously analyze market conditions and coin performance. If a token weakens or trends shift, our team updates the tokens and allocations to protect your long-term returns."
- **On-Screen Text:** Research-backed insights. Pack evolves with the market.

Scene 4: Complete Transparency (0:38 - 0:48)

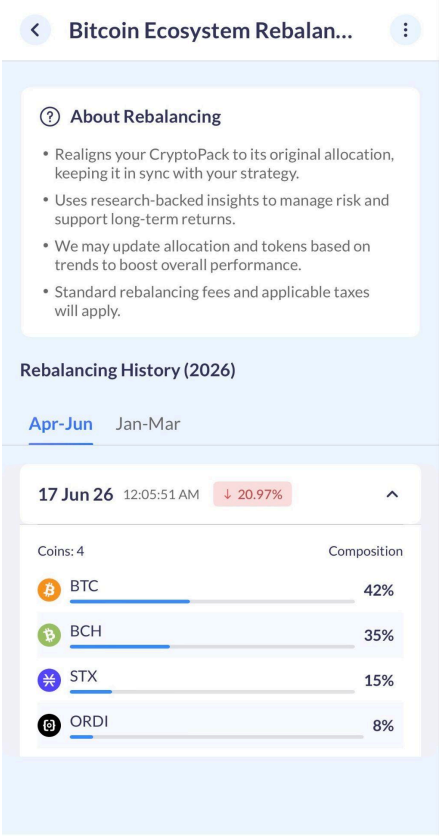

- **Visual:** Cut back to the app UI, specifically the **"Rebalancing History"** screen. The screen scrolls down to show the past logs (e.g., *17 Jun 26*), then highlights the "About Rebalancing" text where fees and taxes are mentioned. A graphical statement receipt briefly pops up.
- **VO:** "We believe in full transparency. You can easily view all past adjustments and check standard fees and applicable taxes right in your CryptoPack history and statements."
- **On-Screen Text:** Track every change. Clear fees & taxes.

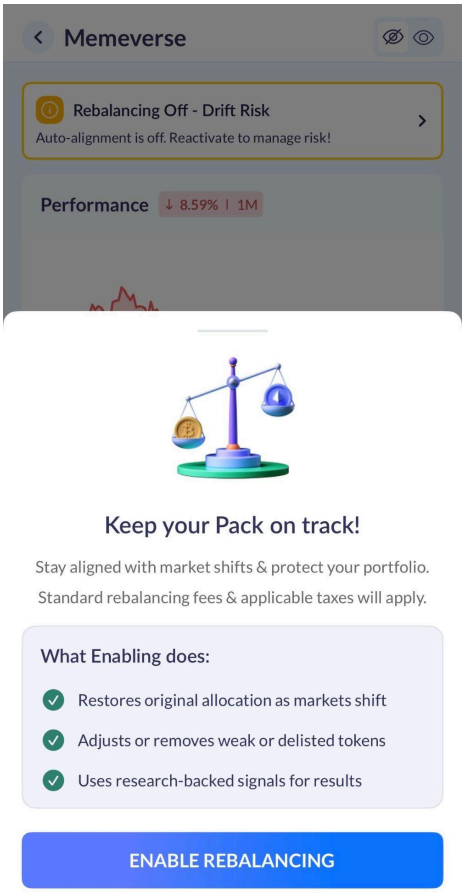

Scene 5: Total Control & Outro (0:48 - 0:60)

- **Visual:** Show the bottom of the history screen with the bright blue **"ENABLE REBALANCING"** button. A cursor taps it, and the vibrant **"Keep your Pack on track!"** confirmation pops up. It then briefly flips to show the **"Disable Rebalancing?"** warning screen to emphasize user choice.
- **VO:** "You are always in control. Enable or disable rebalancing at any time directly from the history screen. Keep your portfolio future-ready with ZebPay."
- **On-Screen Text:** Total Control. Check your CryptoPack Settings today!

In-app Placement

- When the user land on the CryptoPack history page
    - Show the MoEngage in-app bottomsheet template with video and CTA to enable rebalancing
- When rebalancing is off. User clicked on rebalancing yellow banner → Bottomsheet pop-up with enable rebalancing CTA → User dismiss the pop-up
    - Show the MoEngage in-app bottomsheet template with video and CTA to enable rebalancing
